

MEASURING TO REPLACE EXISTING DOORS WITH TRANSOMS

Rectangle – Unit dimension width and height.

Ellipse - There are multiple radius that begin and end at different points so a template is required to ensure accuracy. Overall width and height dimensions are helpful in sizing if the template is not perfect.

True Half Round – Requires, at least, either the width or the height. Providing both would be a good double check that it is indeed a true half round.

Equal Arch Segment - Width, height, and leg measurements are required. (Radius can be substituted for the leg.

Unequal Arch Segment - Width, height, leg, and radius are all required. If radius is unknown, a template is needed.
