

Safe Handling of Waudena Entrance Systems

To ensure the safe handling of entry doors and avoid damage, we recommend the following guidelines:

1. Use the handles that are applied to the side jambs on the unit. They are designed to provide a better grip and are located to avoid Injury while handling a door unit.
2. Team lift is recommended for most units and required for units larger than a single door.
3. Units should be moved and stored in an upright position. Doing so avoids the potential for damage caused by stress on decorative glass and shipping plugs, banding or clips.
4. Avoid leaning smaller units against larger units in your warehouse or on the job site. A smaller door can fall into the jamb cavity of the larger and cause damage.
5. Waudena takes care to package our doors with quality materials to avoid damage in shipment from our production facility, to our dealers, to the job site. All packaging, handles and skid guards or sticking should remain on the product until it arrives at the job site and is ready to be installed into the opening.
